

Sprint 1

- We should probably split the task cards a bit more heading into sprint 2.
- We should have standardized and agreed upon which packages to use and our styling
- We did a great job in separating tasks and assigning closely related tasks to one another.
- We got to know more about firebase systems and react components
- We also created a demo login and logout page.

Sprint 2

- Since we had a lot of time for our sprint 2 user stories, we might have to choose less since sprint 3 is only 2 weeks.
- We were unclear of some specifications of the user profile user story. We should have ironed the details out so that we can build a more complete feature.
- The sprint went fairly well but the tasks that were chosen were actually tougher than expected. Getting the actual UI to look like the UI frameworks was probably the most difficult.
- Another difficulty was when we want to store the states of favorite and unfavorite recipes.
- For the login/log out page, we added material UI to make it more beautiful.

Sprint 3

- Since this sprint was shorter than the rest, we should have tried to get our user stories done during the first half of the sprint rather than the last half.
- This sprint went pretty well as we have all become accustomed to the project. There were no large roadblocks and we finished all of our user stories on time and on feature.
- It came down to the last minute but everyone completed all of their assigned tasks and the demo was successful.
- We first created social media sharing using react-share, but found it not working.
- We switched to separate packages for different medias and it works now.
